Virtual Camera for Blender

Move and tilt your iPhone to control and record your Blender camera.

With Omniscient’s Virtual Camera, your real movements control the Blender camera. In augmented reality (AR) mode, walk to move the camera and tilt your iPhone or iPad to change its angle. Record the movement directly in Blender, and refine your framing with touch gestures and joysticks in the same session. The scene appears live on the device. Connect via QR code on the same local network.

Omniscient also provides camera tracking and LiDAR scanning for visual effects. The app was created by two French founders.

AR mode in Omniscient: the iPhone’s movements control the Blender camera.

At a glance

iPhone and iPad
AR movement and touch controls
Blender on the same local network
Free for personal use
Plus includes a commercial licence

This kit includes images, demo videos, logos and text you can copy for your article.
